Lecture 8:
Deep Learning Software

Today

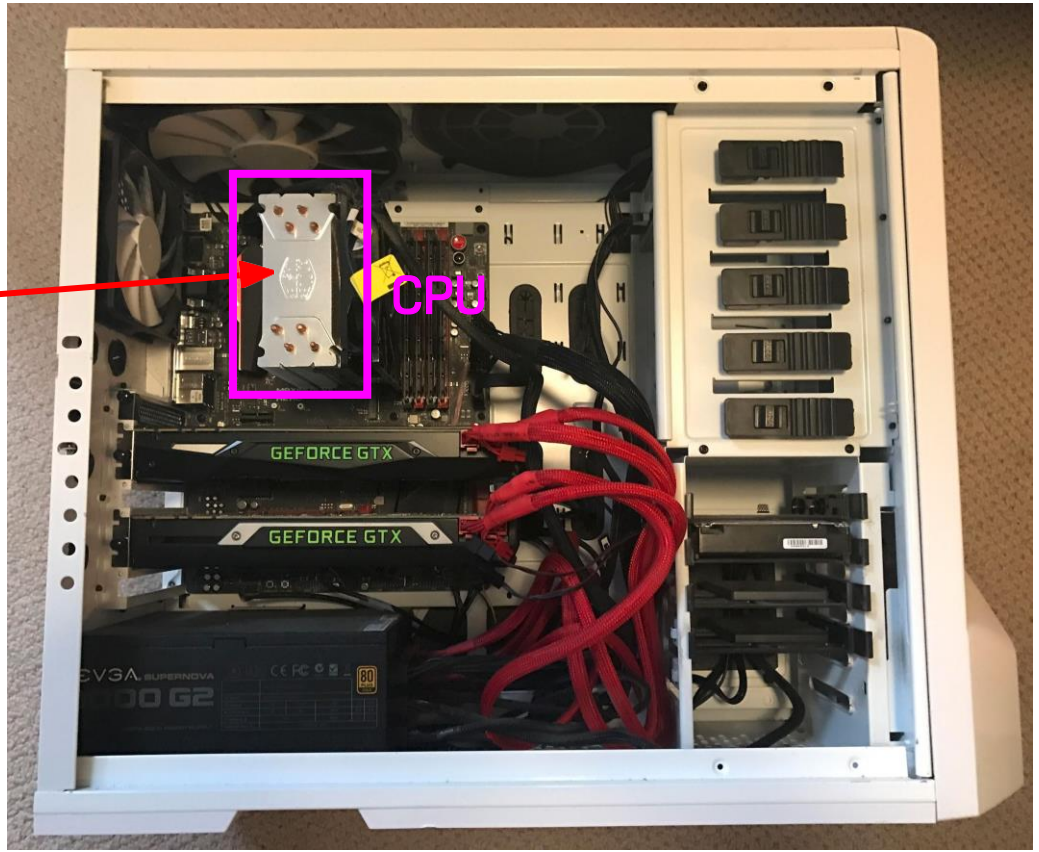
- CPU vs GPU
- Deep Learning Frameworks
  - Caffe / Caffe2
  - Theano / TensorFlow
  - Torch / PyTorch

CPU vs GPU

My computer

Spot the CPU!

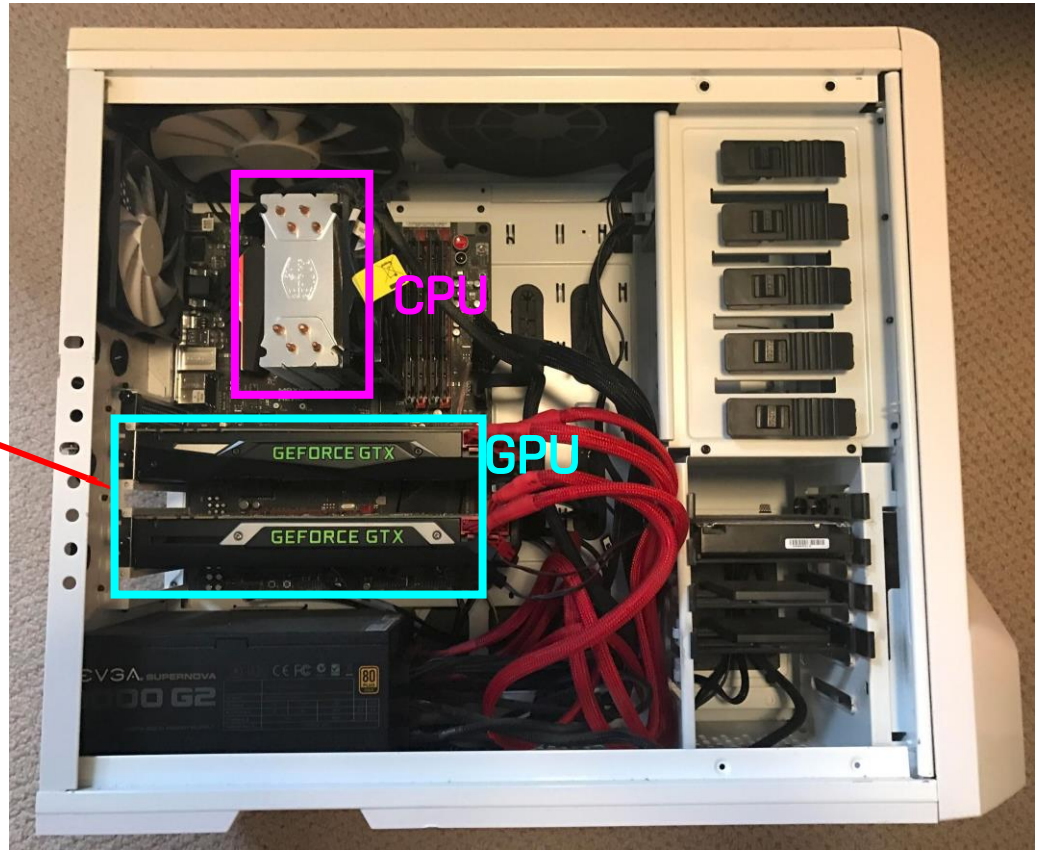
(central processing unit)



Spot the GPUs!

(Graphics Processing Unit,
Graphic Card)

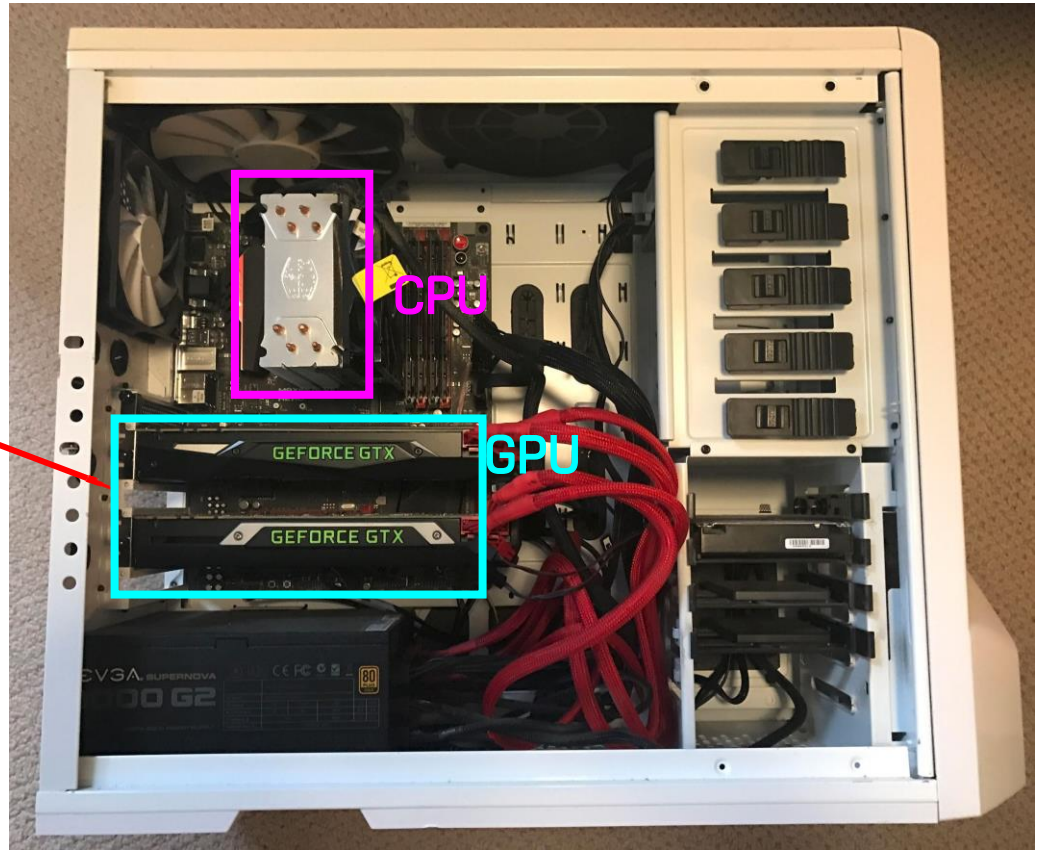
This image is in the public domain



Spot the GPUs!

(Graphics Processing Unit,
Graphic Card)

This image is in the public domain



- CPU는 GPU보다 작다.
- GPU는 CPU에 비해 공간을 많이 차지한다.
- GPU는 쿨러가 있다.

NVIDIA vs AMD

NVIDIA vs AMD

NVIDIA vs AMD

NVIDIA에서는 딥러닝에 적합한 HW를 만들기 위해 노력해왔다.

→ 딥러닝과 관련해서는 NVIDIA가 주로 언급됨!

CPU vs GPU

	# Cores	Clock Speed	Memory	Price
CPU (Intel Core i7-7700k)	4 (8 threads with hyperthreading)	4.4 GHz	Shared with system	$339
CPU (Intel Core i7-6950X)	10 (20 threads with hyperthreading)	3.5 GHz	Shared with system	$1723
GPU (NVIDIA Titan Xp)	3840	1.6 GHz	12 GB GDDR5X	$1200
GPU (NVIDIA GTX 1070)	1920	1.68 GHz	8 GB GDDR5	$399

CPU vs GPU

	# Cores	Clock Speed	Memory	Price
CPU (Intel Core i7-7700k)	4 (8 threads with hyperthreading)	4.4 GHz	Shared with system	$339
CPU (Intel Core i7-6950X)	10 (20 threads with hyperthreading)	3.5 GHz	Shared with system	$1723
GPU (NVIDIA Titan Xp)	3840	1.6 GHz	12 GB GDDR5X	$1200
GPU (NVIDIA GTX 1070)	1920	1.68 GHz	8 GB GDDR5	$399

Intel의 (강의당시) 최신 상업용 CPU

NVIDIA의 (강의당시) 최신 상업용 GPU

CPU vs GPU

	# Cores	Clock Speed	Memory	Price
CPU (Intel Core i7-7700k)	4 (8 threads with hyperthreading)	4.4 GHz	Shared with system	$339
CPU (Intel Core i7-6950X)	10 (20 threads with hyperthreading)	3.5 GHz	Shared with system	$1723
GPU (NVIDIA Titan Xp)	3840	1.6 GHz	12 GB GDDR5X	$1200
GPU (NVIDIA GTX 1070)	1920	1.68 GHz	8 GB GDDR5	$399

→ Hyperthreading: 보통은 코어 1개당 쓰레드 1개가 기본이지만,
이 기술을 이용하면 코어 1개당 쓰레드 2개가 된다!

	CPU	GPU
Core의 수	4~6개, 많으면 10개	수천개
Task 수행 방법	독립적 수행	병렬적 수행 (독립적으로 동작하지 않는다.)
memory	RAM에서 끌어다쓴다.	칩 안에 존재한다.

CPU vs GPU

	# Cores	Clock Speed	Memory	Price
CPU (Intel Core i7-7700k)	4 (8 threads with hyperthreading)	4.4 GHz	Shared with system	$339
CPU (Intel Core i7-6950X)	10 (20 threads with hyperthreading)	3.5 GHz	Shared with system	$1723
GPU (NVIDIA Titan Xp)	3840	1.6 GHz	12 GB GDDR5X	$1200
GPU (NVIDIA GTX 1070)	1920	1.68 GHz	8 GB GDDR5	$399

	CPU	GPU
Core의 수	4~6개, 많으면 10개	수천개
Task 수행 방법	독립적 수행	병렬적 수행 (독립적으로 동작하지 않는다.)
memory	RAM에서 끌어다쓴다.	칩 안에 존재한다.

CPU vs GPU

	# Cores	Clock Speed	Memory	Price
CPU (Intel Core i7-7700k)	4 (8 threads with hyperthreading)	4.4 GHz	Shared with system	$339
CPU (Intel Core i7-6950X)	10 (20 threads with hyperthreading)	3.5 GHz	Shared with system	$1723

GPU (NVIDIA GTX 1070)	1920	1.68 GHz	8 GB GDDR5	$399

GPU의 Core

- 각각의 core가 CPU의 core에 비해서 더 느린 clock speed에서 작동한다.
- 독립적으로 동작할 수 없고 하나의 task를 병렬적으로 수행한다. (core의 수가 많기 때문에 병렬 수행에 적합하다)

	CPU	GPU
Core의 수	4~6개, 많으면 10개	수천개
Task 수행 방법	독립적 수행	병렬적 수행 (독립적으로 동작하지 않는다.)
memory	RAM에서 끌어다쓴다.	칩 안에 존재한다.

NVIDIA TITAN RTX

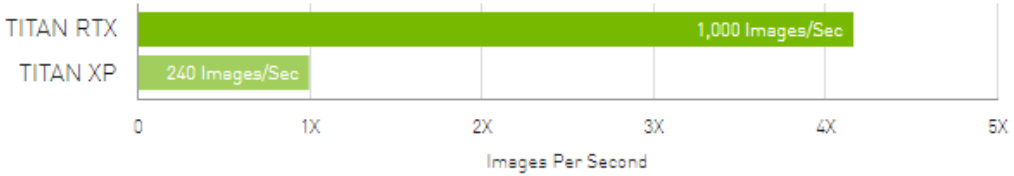
NVIDIA® TITAN RTX™는 현존하는 최고 속도의 PC 그래픽 카드입니다. 화려한 수상 경력에 빛나는 Turing™ 아키텍처의 지원을 받아 130 Tensor TFLOPS의 성능, 576개의 Tensor 코어 및 엄청나게 빠른 24GB 용량의 GDDR6 메모리를 사용자의 PC에 제공합니다.

구매하기

사양 모듈

아키텍처	NVIDIA Turing
프레임 버퍼	24 GB GDDR6
부스트 클럭	1770 MHz
Tensor 코어	576
CUDA 코어	4608

이미지 인식(ResNet-50)



MXNet을 활용한 ResNet-50 트레이닝 | NGC 컨테이너 18.11 | Titan XP BS=96 | Titan RTX BS=256

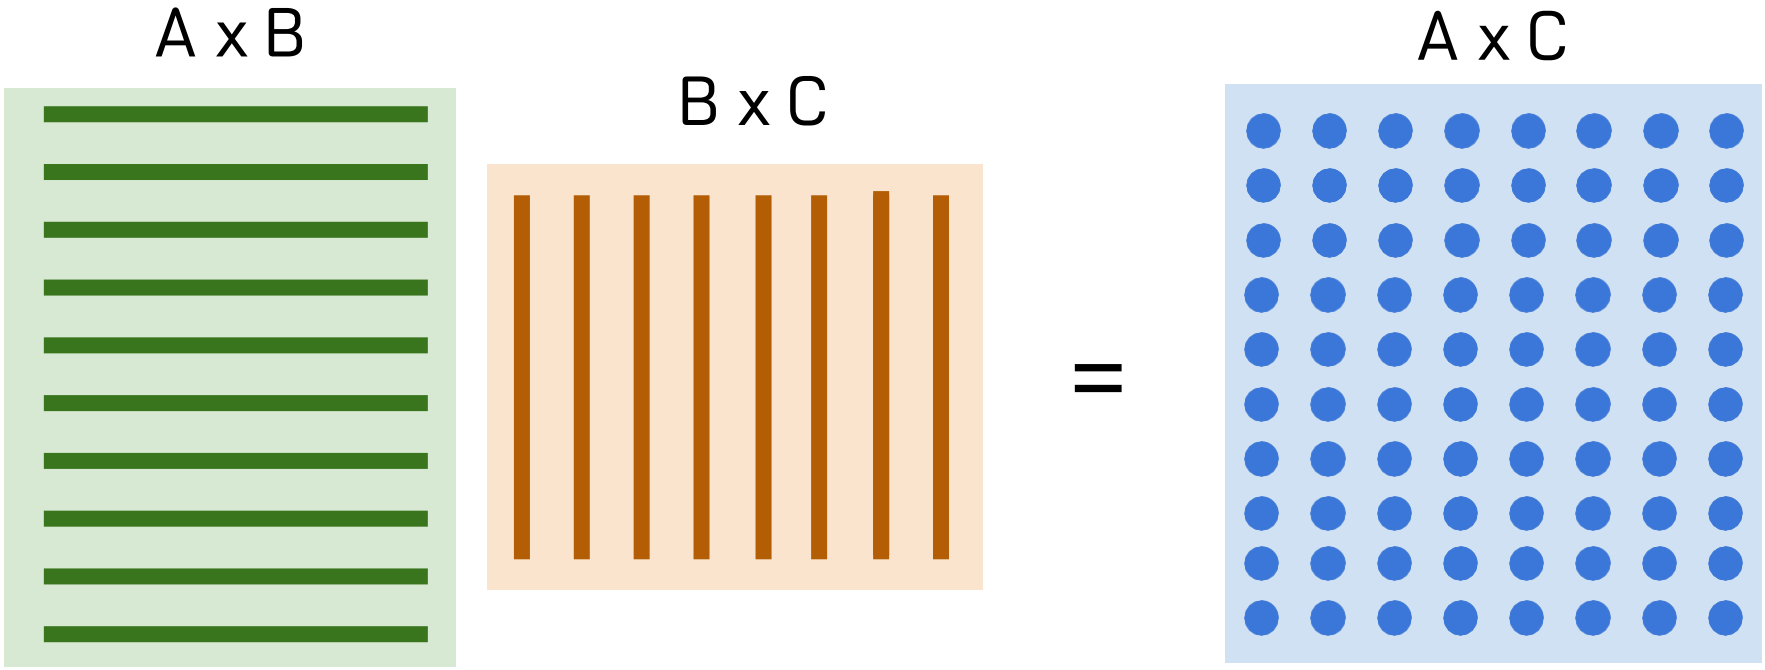
NVIDIA TITAN RTX (Turing)

[예약판매]NVIDIA TITAN RTX (Turing) 리더스시스템즈

3,399,000원

출처: NVIDIA 홈페이지, 11번가

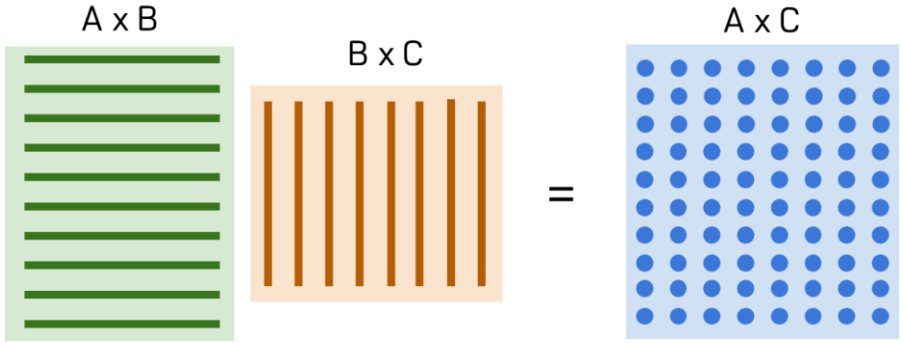
Example: Matrix Multiplication - GPU에서 잘 동작한다.



원소가 독립적이다
→ 병렬 수행이 가능하다

독립적?

- 종속적이지 않다.



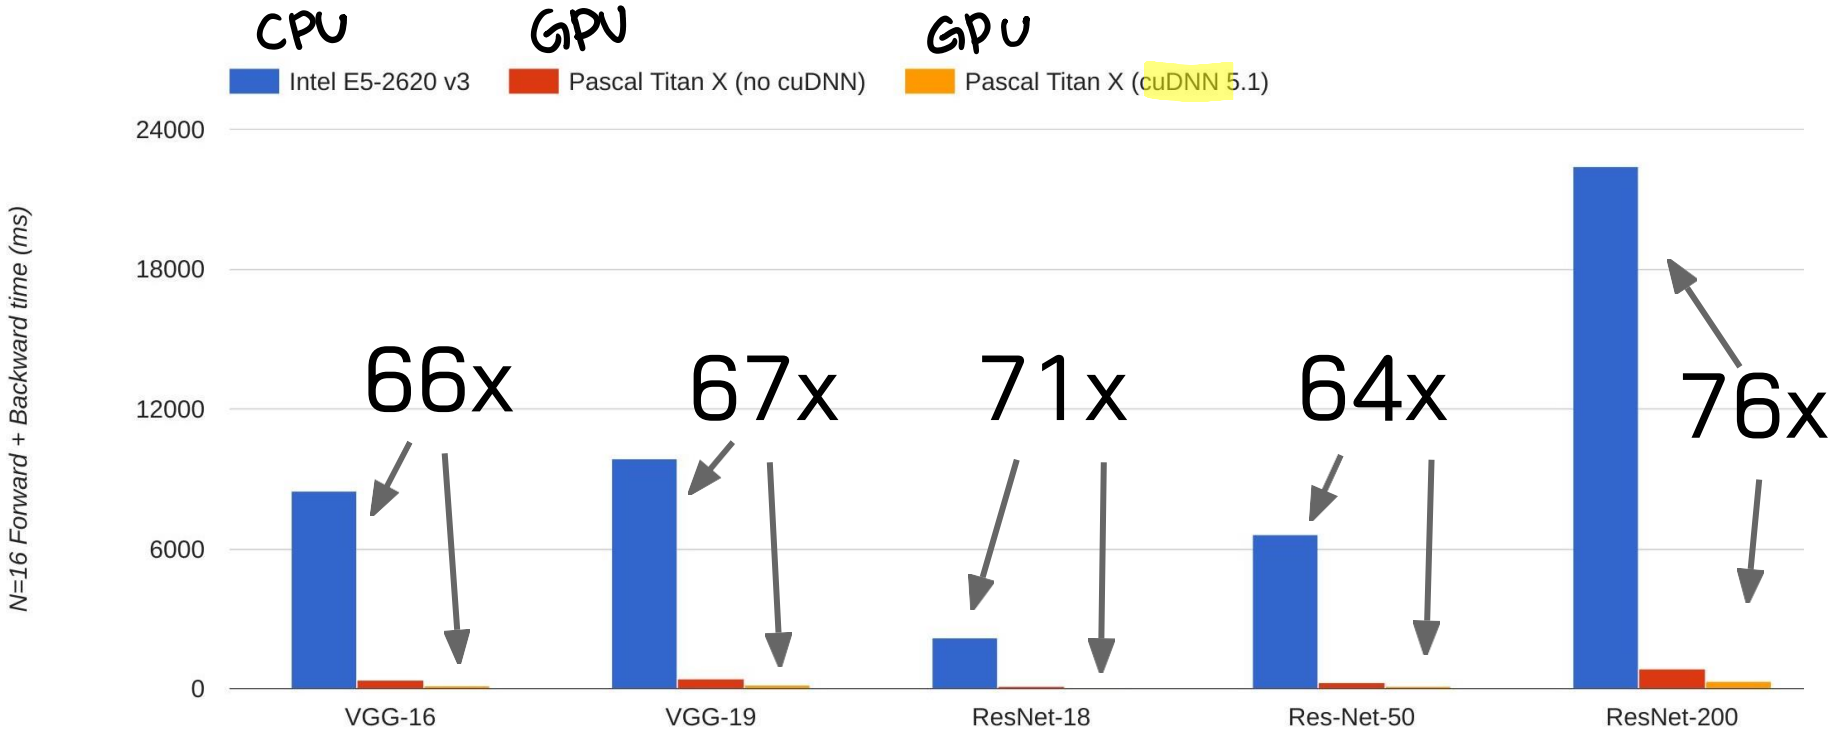
- 각 원소들은 모두 같은 일을 수행하므로 행과 열 요소를 병렬적으로 계산 할 수 있다.

Programming GPUs

- CUDA
  - C언어처럼 생겼음
  - NVIDIA GPU에서만 실행 가능
  - GPU에 최적화된 API들 제공 – cuBLAS, cuFFT, cuDNN, etc
    - 제공하는 이유: GPU 성능을 효율적으로 이용하는 코드를 우리가 짜기는 어렵다.
    - cuBLAS: 행렬곱 등의 연산 제공, cuDNN: convolution, rnn, 등등 딥러닝에 필요한 연산 제공
- OpenCL
  - CUDA와 비슷, NVIDIA와 AMD, CPU에서도 사용 가능
  - 딥러닝에 매우 최적화되지는 않았음(CUDA보다 성능 안좋음)

CPU vs GPU in practice

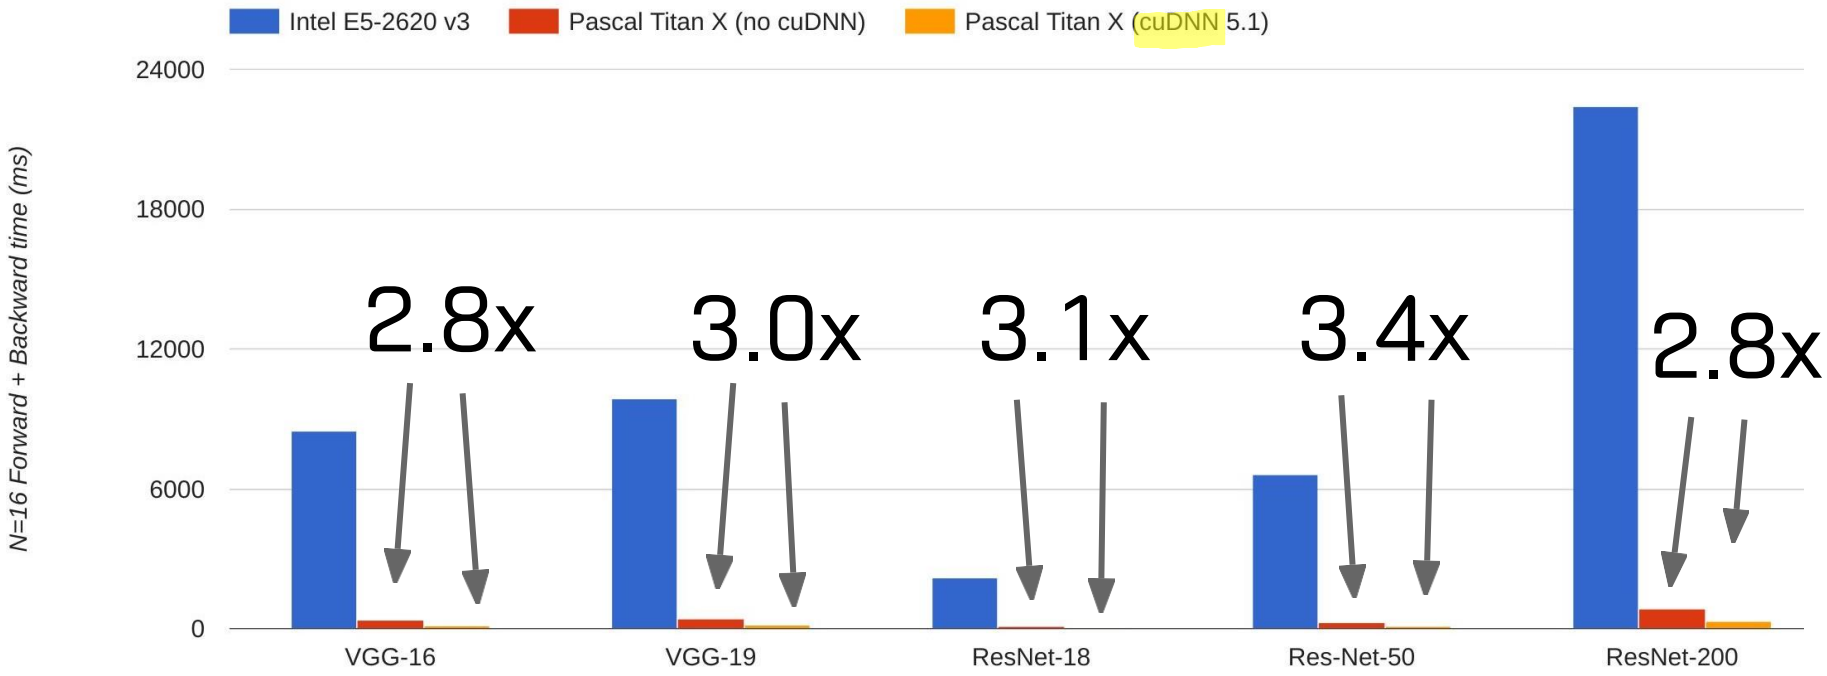
(GPU는 최고의 성능을 내게끔 setting했지만 CPU는 최적화되진 않아서 정확한 비교 결과는 아님)



Data from https://github.com/jcjohnson/cnn-benchmarks

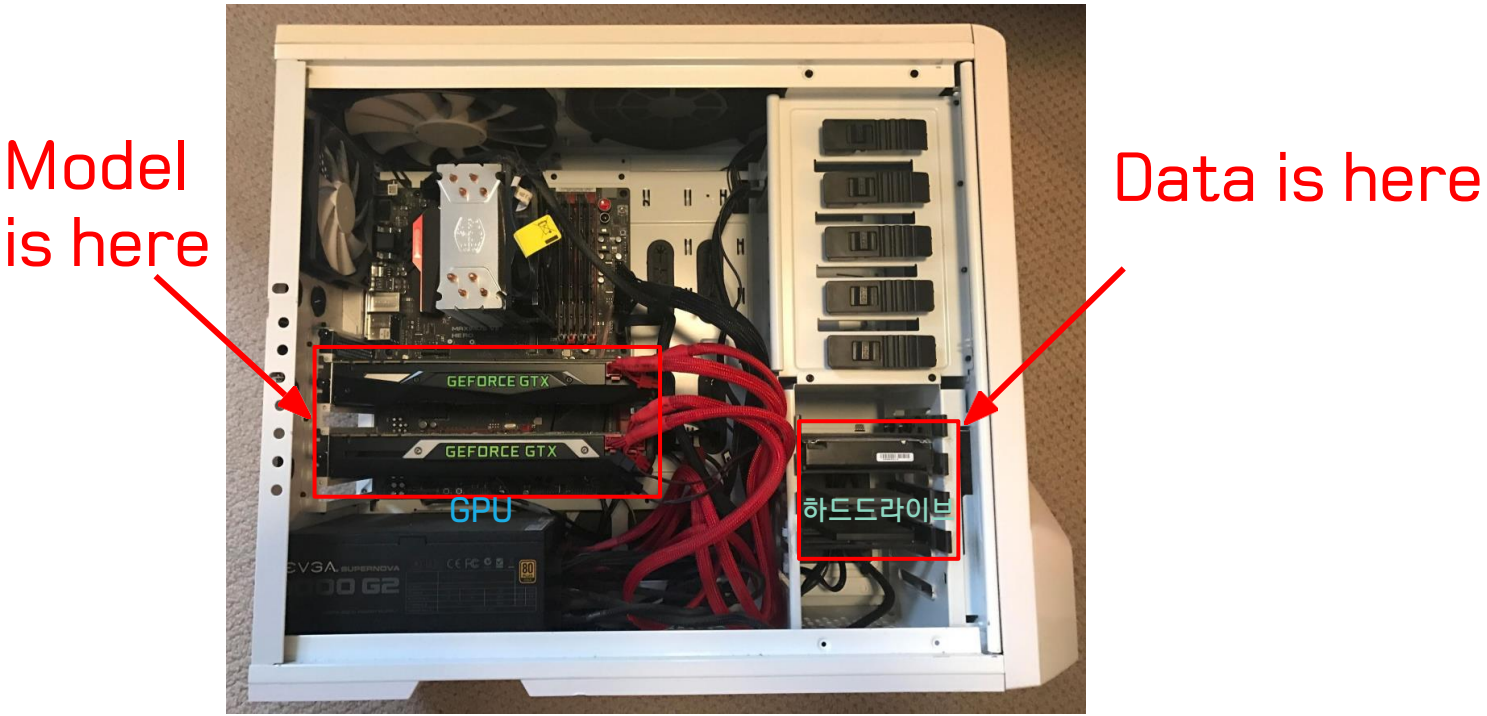
CPU vs GPU in practice

cuDNN much faster than "unoptimized" CUDA

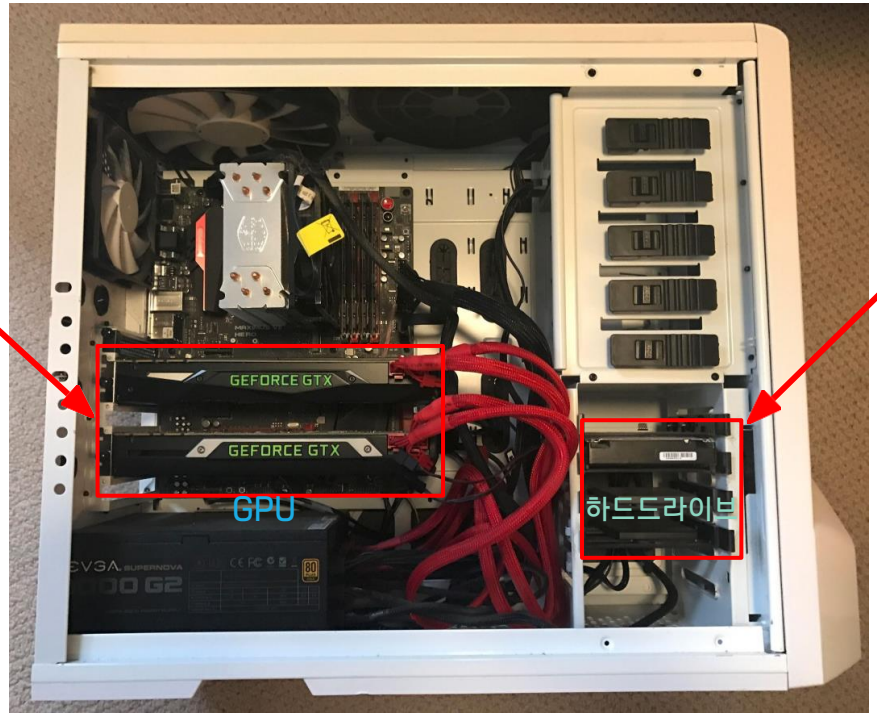


Data from https://github.com/jcjohnson/cnn-benchmarks

CPU / GPU Communication



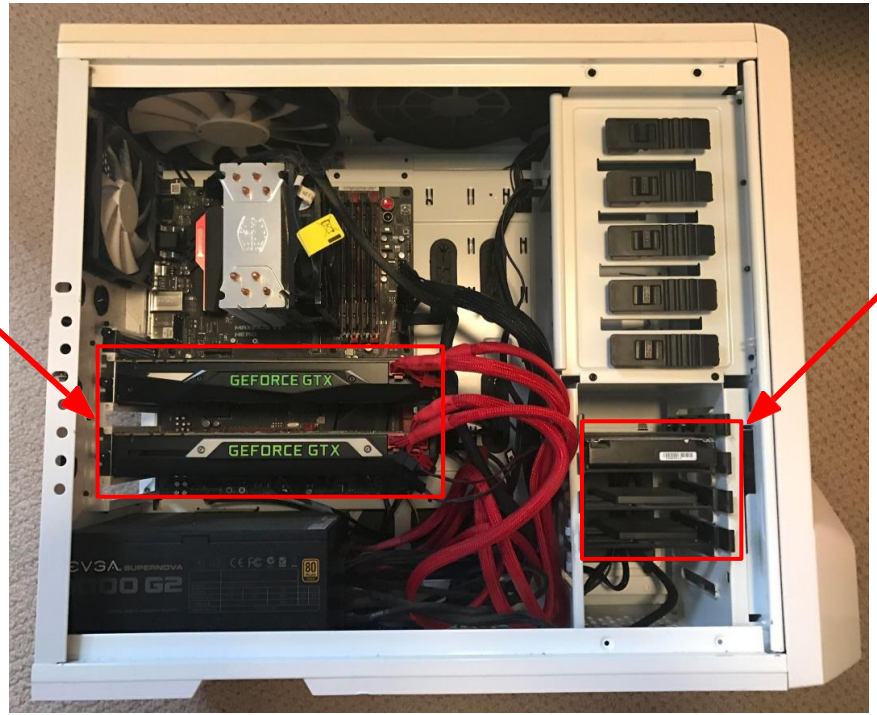
CPU / GPU Communication



Train시 디스크에서 데이터를 읽어오는데에서 bottleneck 발생

CPU / GPU Communication

Model is here



Data is here

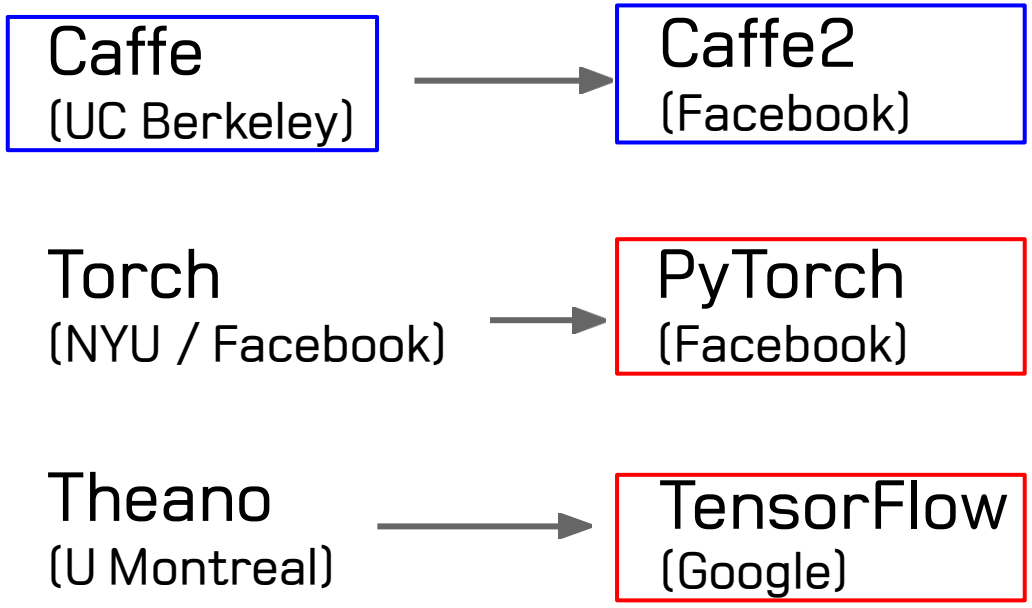
Solutions:

- Data 전체를 RAM에 올린다.
- HDD 대신 SSD를 사용한다.
- pre-fetching

pre-fetching: CPU의 멀티스레드를 이용하여
필요한 데이터를 RAM에 미리 올림.
이후 buffer에서 GPU로 데이터 전송

Deep Learning Frameworks

A bit about these



Mostly these

Paddle
(Baidu)

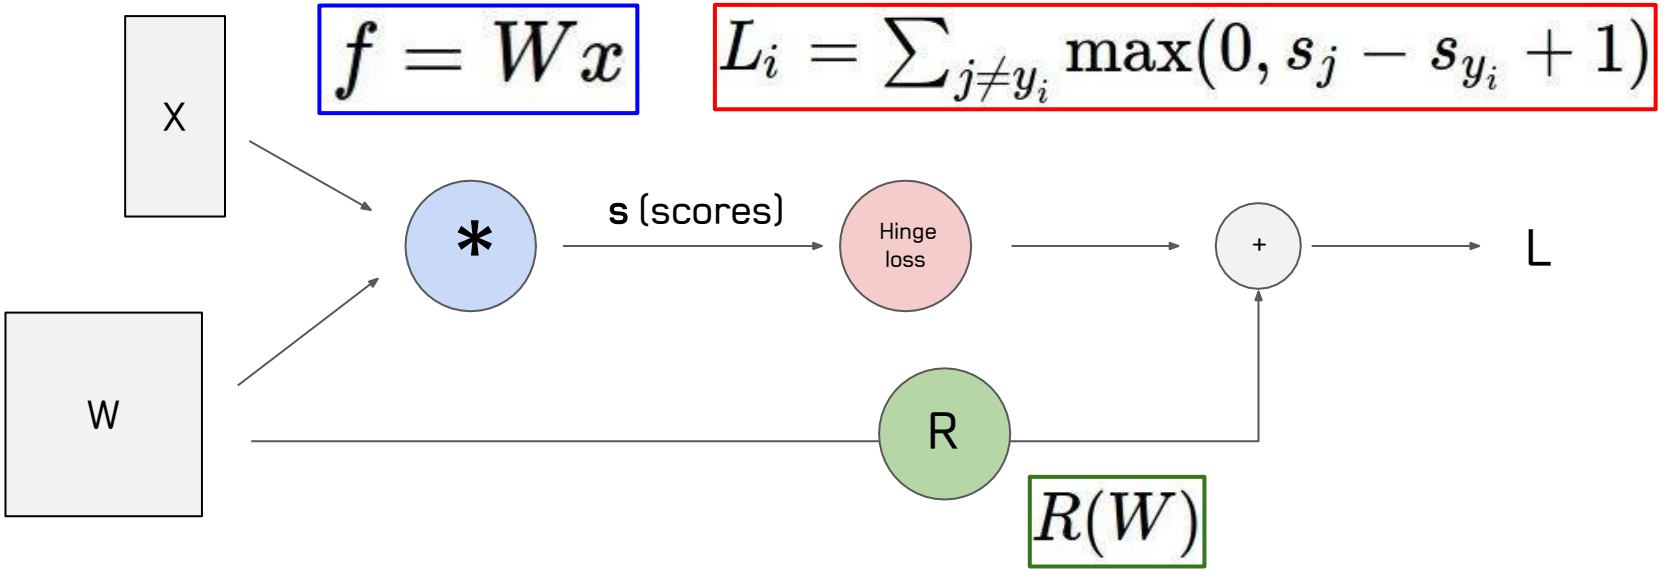
CNTK
(Microsoft)

MXNet
(Amazon)

Developed by U Washington, CMU, MIT, Hong Kong U, etc but main framework of choice at AWS

And others...

Recall: Computational Graphs

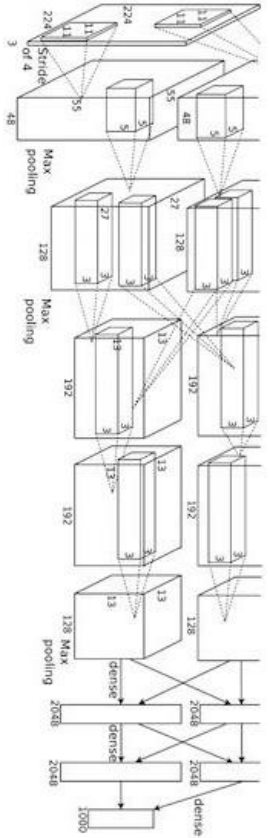


Recall: Computational Graphs

input image

weighs

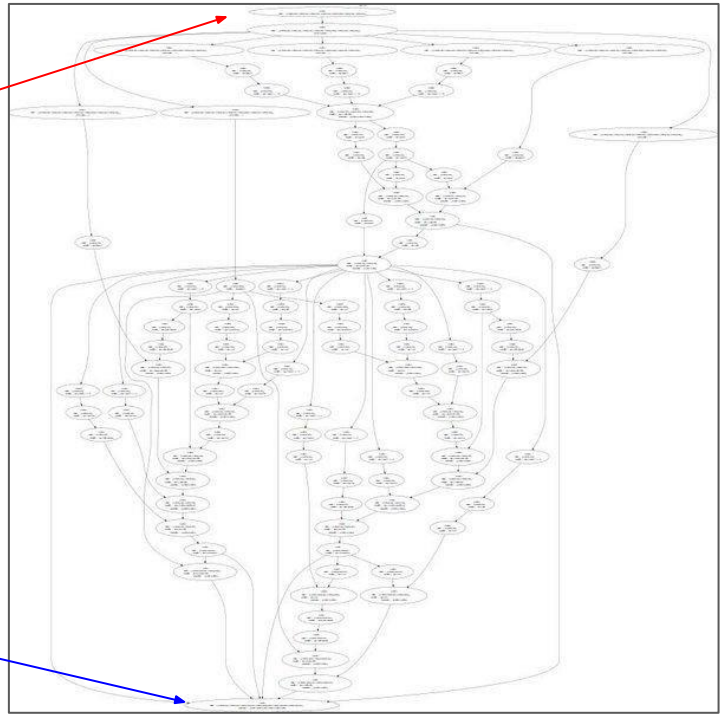
loss



Recall: Computational Graphs

input image

loss



딥러닝 framework를 사용하는 이유

(1) 복잡한 그래프를 직접 만들지 않아도 된다.

(2) Forward pass만 잘 구현 해놓으면 back propagation은 알아서 구성된다.

(3) 우리가 GPU의 효율성을 고려한 코드를 짜긴 어렵다.

Computational Graphs

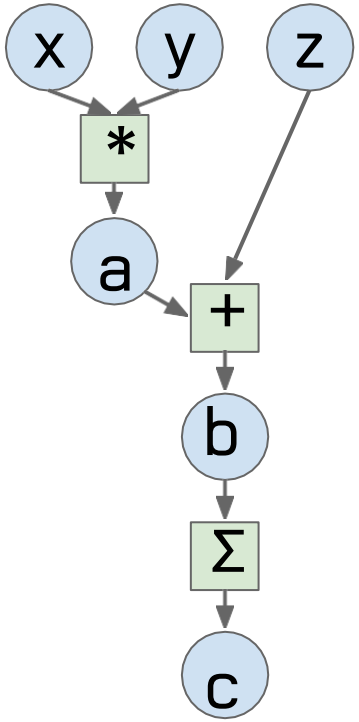
Numpy

```
import numpy as np
np.random.seed(0)

N, D = 3, 4

x = np.random.randn(N, D)
y = np.random.randn(N, D)
z = np.random.randn(N, D)

a = x * y
b = a + z
c = np.sum(b)
```



$x * y = a$

$a + z = b$

$\Sigma b = c$

Computational Graphs

Numpy

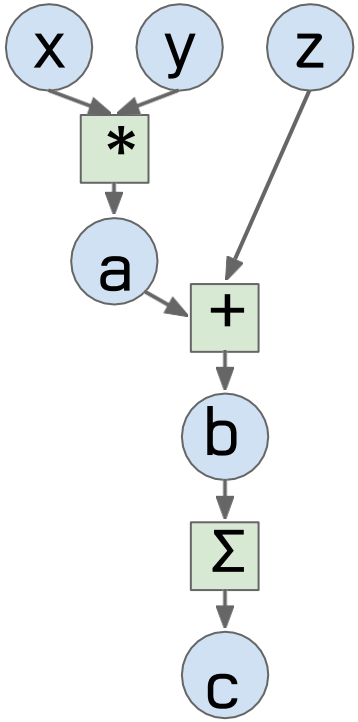
```
import numpy as np
np.random.seed(0)

N, D = 3, 4

x = np.random.randn(N, D)
y = np.random.randn(N, D)
z = np.random.randn(N, D)

a = x * y
b = a + z
c = np.sum(b)

grad_c = 1.0
grad_b = grad_c * np.ones((N, D))
grad_a = grad_b.copy()
grad_z = grad_b.copy()
grad_x = grad_a * y
grad_y = grad_a * x
```



Computational Graphs

Numpy

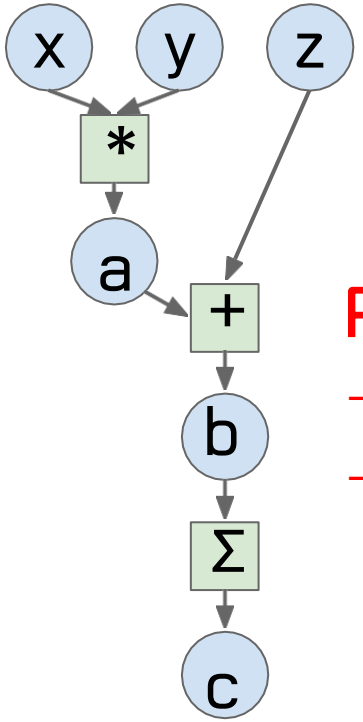
```
import numpy as np
np.random.seed(0)

N, D = 3, 4

x = np.random.randn(N, D)
y = np.random.randn(N, D)
z = np.random.randn(N, D)

a = x * y
b = a + z
c = np.sum(b)

grad_c = 1.0
grad_b = grad_c * np.ones((N, D))
grad_a = grad_b.copy()
grad_z = grad_b.copy()
grad_x = grad_a * y
grad_y = grad_a * x
```



Problems:

- Numpy는 GPU에서 돌아가지 않는다.
- Gradient를 그때그때 계산해줘야한다.

Computational Graphs

Numpy

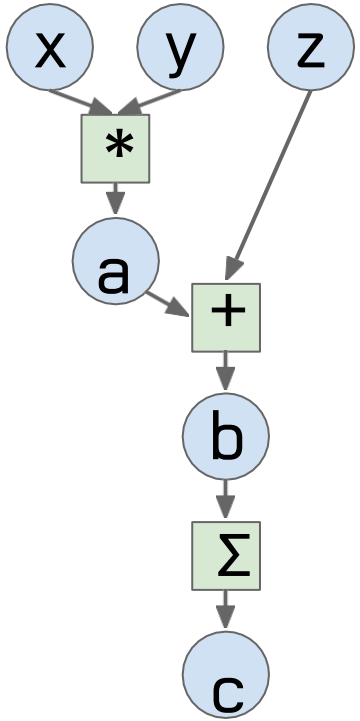
```
import numpy as np
np.random.seed(0)

N, D = 3, 4

x = np.random.randn(N, D)
y = np.random.randn(N, D)
z = np.random.randn(N, D)

a = x * y
b = a + z
c = np.sum(b)

grad_c = 1.0
grad_b = grad_c * np.ones((N, D))
grad_a = grad_b.copy()
grad_z = grad_b.copy()
grad_x = grad_a * y
grad_y = grad_a * x
```



TensorFlow

```
# Basic computational graph
import numpy as np
np.random.seed(0)
import tensorflow as tf

N, D = 3, 4

x = tf.placeholder(tf.float32)
y = tf.placeholder(tf.float32)
z = tf.placeholder(tf.float32)

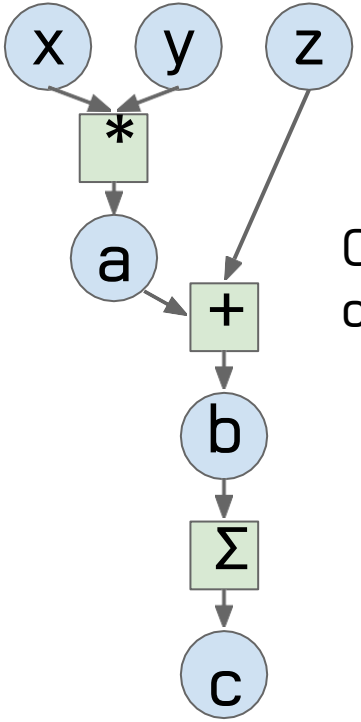
a = x * y
b = a + z
c = tf.reduce_sum(b)

grad_x, grad_y, grad_z = tf.gradients(c, [x, y, z])

with tf.Session() as sess:
    values = {
        x: np.random.randn(N, D),
        y: np.random.randn(N, D),
        z: np.random.randn(N, D),
    }
    out = sess.run([c, grad_x, grad_y, grad_z],
                   feed_dict=values)
    c_val, grad_x_val, grad_y_val, grad_z_val = out
```

딥러닝 Framework의 목표: numpy 스럽게 작성→ GPU에서도 돌아가고 gradient도 알아서 계산

Computational Graphs



Create forward computational graph

Numpy

```
import numpy as np
np.random.seed(0)

N, D = 3, 4

x = np.random.randn(N, D)
y = np.random.randn(N, D)
z = np.random.randn(N, D)

a = x * y
b = a + z
c = np.sum(b)
```

TensorFlow

```
# Basic computational graph
import numpy as np
np.random.seed(0)
import tensorflow as tf

N, D = 3, 4

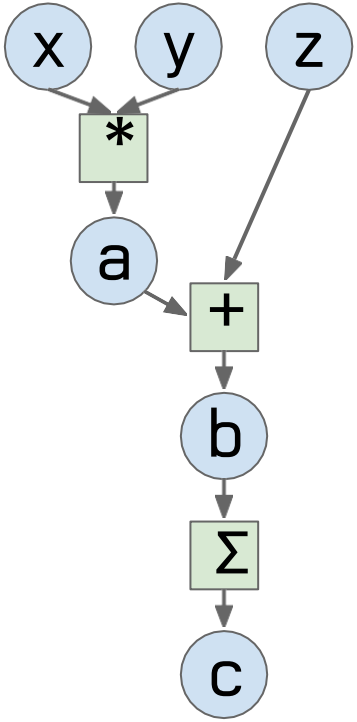
x = tf.placeholder(tf.float32)
y = tf.placeholder(tf.float32)
z = tf.placeholder(tf.float32)

a = x * y
b = a + z
c = tf.reduce_sum(b)

grad_x, grad_y, grad_z = tf.gradients(c, [x, y, z])

with tf.Session() as sess:
    values = {
        x: np.random.randn(N, D),
        y: np.random.randn(N, D),
        z: np.random.randn(N, D),
    }
    out = sess.run([c, grad_x, grad_y, grad_z],
                   feed_dict=values)
    c_val, grad_x_val, grad_y_val, grad_z_val = out
```

Computational Graphs



Ask TensorFlow to compute gradients

TensorFlow

```
# Basic computational graph
import numpy as np
np.random.seed(0)
import tensorflow as tf

N, D = 3, 4

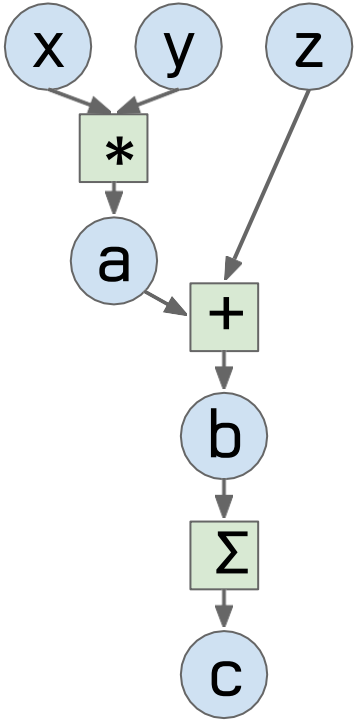
x = tf.placeholder(tf.float32)
y = tf.placeholder(tf.float32)
z = tf.placeholder(tf.float32)

a = x * y
b = a + z
c = tf.reduce_sum(b)

grad_x, grad_y, grad_z = tf.gradients(c, [x, y, z])

with tf.Session() as sess:
    values = {
        x: np.random.randn(N, D),
        y: np.random.randn(N, D),
        z: np.random.randn(N, D),
    }
    out = sess.run([c, grad_x, grad_y, grad_z],
                   feed_dict=values)
    c_val, grad_x_val, grad_y_val, grad_z_val = out
```

Computational Graphs



Tell TensorFlow to run on CPU

TensorFlow

```
import numpy as np
np.random.seed(0)
import tensorflow as tf

N, D = 3000, 4000

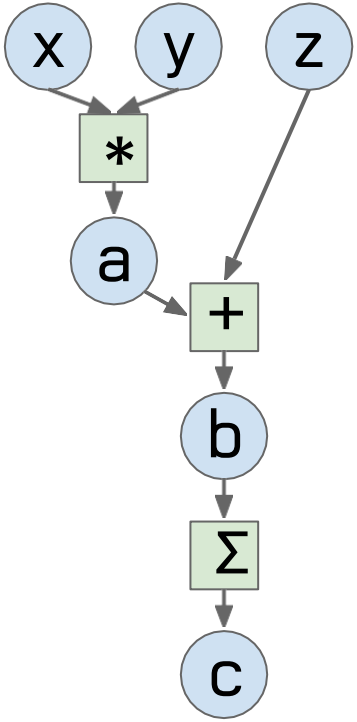
with tf.device('/cpu:0'):
    x = tf.placeholder(tf.float32)
    y = tf.placeholder(tf.float32)
    z = tf.placeholder(tf.float32)

    a = x * y
    b = a + z
    c = tf.reduce_sum(b)

grad_x, grad_y, grad_z = tf.gradients(c, [x, y, z])

with tf.Session() as sess:
    values = {
        x: np.random.randn(N, D),
        y: np.random.randn(N, D),
        z: np.random.randn(N, D),
    }
    out = sess.run([c, grad_x, grad_y, grad_z],
                   feed_dict=values)
    c_val, grad_x_val, grad_y_val, grad_z_val = out
```

Computational Graphs



Tell TensorFlow to run on GPU

TensorFlow

```
import numpy as np
np.random.seed(0)
import tensorflow as tf

N, D = 3000, 4000

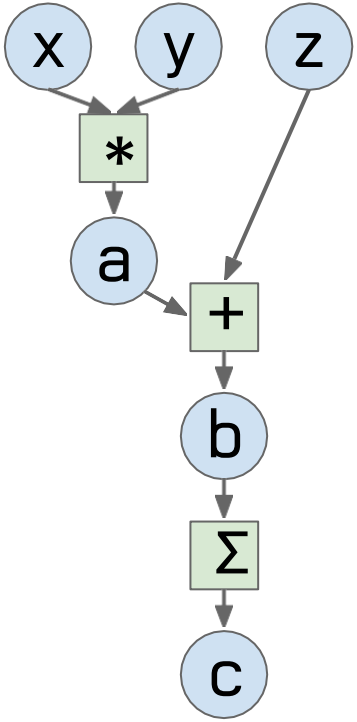
with tf.device('/gpu:0'):
    x = tf.placeholder(tf.float32)
    y = tf.placeholder(tf.float32)
    z = tf.placeholder(tf.float32)

    a = x * y
    b = a + z
    c = tf.reduce_sum(b)

grad_x, grad_y, grad_z = tf.gradients(c, [x, y, z])

with tf.Session() as sess:
    values = {
        x: np.random.randn(N, D),
        y: np.random.randn(N, D),
        z: np.random.randn(N, D),
    }
    out = sess.run([c, grad_x, grad_y, grad_z],
                   feed_dict=values)
    c_val, grad_x_val, grad_y_val, grad_z_val = out
```

Computational Graphs



Tell TensorFlow to run on GPU

TensorFlow

- 간단한 코드 변경으로 CPU/GPU 변환이 가능하다.
- 간단한 코드 추가로 모든 gradient의 계산이 가능하다.

TensorFlow

```
import numpy as np
np.random.seed(0)
import tensorflow as tf

N, D = 3000, 4000

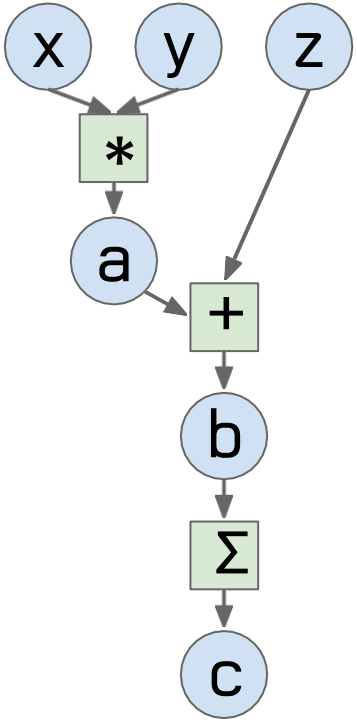
with tf.device('/gpu:0'):
    x = tf.placeholder(tf.float32)
    y = tf.placeholder(tf.float32)
    z = tf.placeholder(tf.float32)

    a = x * y
    b = a + z
    c = tf.reduce_sum(b)

grad_x, grad_y, grad_z = tf.gradients(c, [x, y, z])

with tf.Session() as sess:
    values = {
        x: np.random.randn(N, D),
        y: np.random.randn(N, D),
        z: np.random.randn(N, D),
    }
    out = sess.run([c, grad_x, grad_y, grad_z],
                   feed_dict=values)
    c_val, grad_x_val, grad_y_val, grad_z_val = out
```

Computational Graphs



PyTorch

```
import torch
from torch.autograd import Variable

N, D = 3, 4

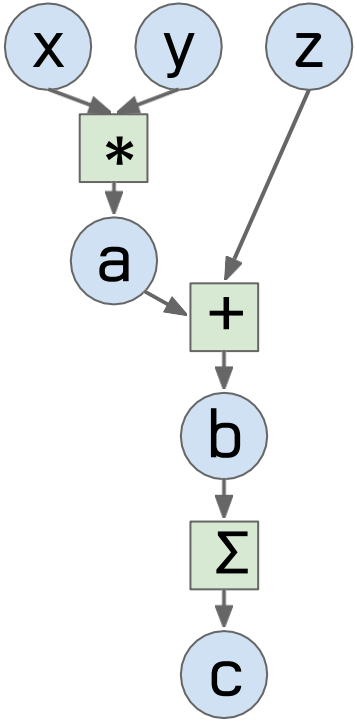
x = Variable(torch.randn(N, D),
             requires_grad=True)
y = Variable(torch.randn(N, D),
             requires_grad=True)
z = Variable(torch.randn(N, D),
             requires_grad=True)

a = x * y
b = a + z
c = torch.sum(b)

c.backward()

print(x.grad.data)
print(y.grad.data)
print(z.grad.data)
```

Computational Graphs



Define **Variables** to start building a computational graph

PyTorch

```
import torch
from torch.autograd import Variable

N, D = 3, 4

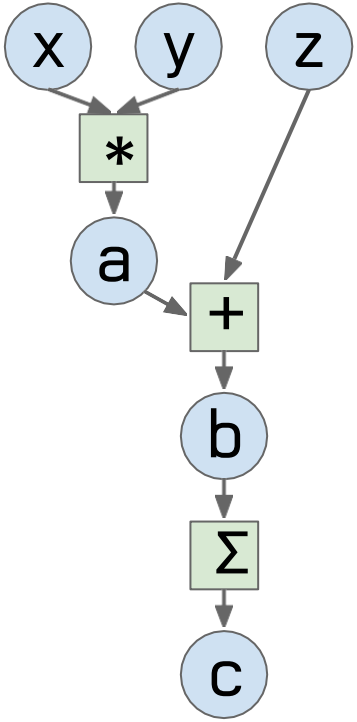
x = Variable(torch.randn(N, D),
             requires_grad=True)
y = Variable(torch.randn(N, D),
             requires_grad=True)
z = Variable(torch.randn(N, D),
             requires_grad=True)

a = x * y
b = a + z
c = torch.sum(b)

c.backward()

print(x.grad.data)
print(y.grad.data)
print(z.grad.data)
```

Computational Graphs



Numpy

```
import numpy as np
np.random.seed(0)

N, D = 3, 4

x = np.random.randn(N, D)
y = np.random.randn(N, D)
z = np.random.randn(N, D)

a = x * y
b = a + z
c = np.sum(b)
```

Forward pass looks just like numpy

PyTorch

```
import torch
from torch.autograd import Variable

N, D = 3, 4

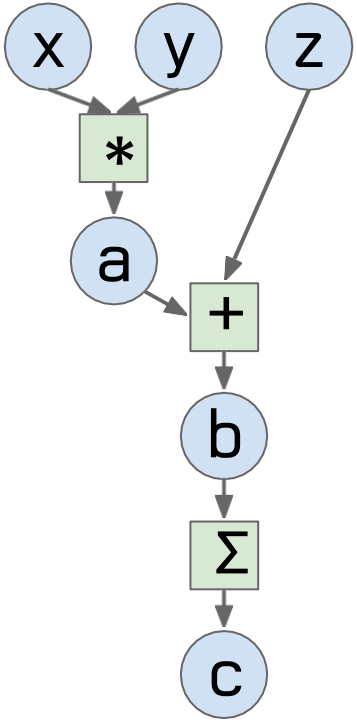
x = Variable(torch.randn(N, D),
             requires_grad=True)
y = Variable(torch.randn(N, D),
             requires_grad=True)
z = Variable(torch.randn(N, D),
             requires_grad=True)

a = x * y
b = a + z
c = torch.sum(b)

c.backward()

print(x.grad.data)
print(y.grad.data)
print(z.grad.data)
```

Computational Graphs



Calling c.backward() computes all gradients

PyTorch

```
import torch
from torch.autograd import Variable

N, D = 3, 4

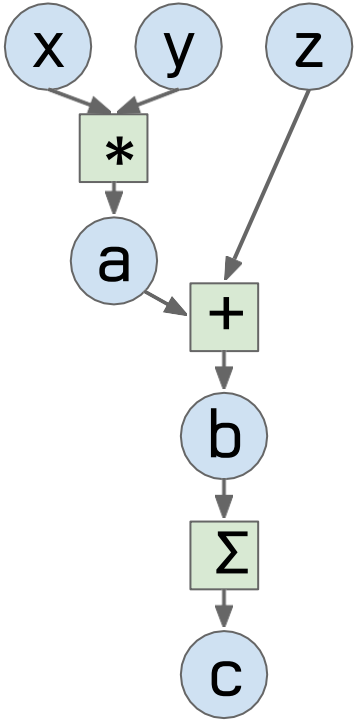
x = Variable(torch.randn(N, D),
             requires_grad=True)
y = Variable(torch.randn(N, D),
             requires_grad=True)
z = Variable(torch.randn(N, D),
             requires_grad=True)

a = x * y
b = a + z
c = torch.sum(b)

c.backward()

print(x.grad.data)
print(y.grad.data)
print(z.grad.data)
```

Computational Graphs



Run on GPU by casting to .cuda()

PyTorch

```
import torch
from torch.autograd import Variable

N, D = 3, 4

x = Variable(torch.randn(N, D).cuda(),
             requires_grad=True)
y = Variable(torch.randn(N, D).cuda(),
             requires_grad=True)
z = Variable(torch.randn(N, D).cuda(),
             requires_grad=True)

a = x * y
b = a + z
c = torch.sum(b)

c.backward()

print(x.grad.data)
print(y.grad.data)
print(z.grad.data)
```

Numpy

```
import numpy as np
np.random.seed(0)

N, D = 3, 4

x = np.random.randn(N, D)
y = np.random.randn(N, D)
z = np.random.randn(N, D)

a = x * y
b = a + z
c = np.sum(b)

grad_c = 1.0
grad_b = grad_c * np.ones((N, D))
grad_a = grad_b.copy()
grad_z = grad_b.copy()
grad_x = grad_a * y
grad_y = grad_a * x
```

TensorFlow

```
import numpy as np
np.random.seed(0)
import tensorflow as tf

N, D = 3, 4

with tf.device('/gpu:0'):
    x = tf.placeholder(tf.float32)
    y = tf.placeholder(tf.float32)
    z = tf.placeholder(tf.float32)

    a = x * y
    b = a + z
    c = tf.reduce_sum(b)

grad_x, grad_y, grad_z = tf.gradients(c, [x, y, z])

with tf.Session() as sess:
    values = {
        x: np.random.randn(N, D),
        y: np.random.randn(N, D),
        z: np.random.randn(N, D),
    }
    out = sess.run([c, grad_x, grad_y, grad_z],
                   feed_dict=values)
    c_val, grad_x_val, grad_y_val, grad_z_val = out
```

PyTorch

```
import torch
from torch.autograd import Variable

N, D = 3, 4

x = Variable(torch.randn(N, D).cuda(),
             requires_grad=True)
y = Variable(torch.randn(N, D).cuda(),
             requires_grad=True)
z = Variable(torch.randn(N, D).cuda(),
             requires_grad=True)

a = x * y
b = a + z
c = torch.sum(b)

c.backward()

print(x.grad.data)
print(y.grad.data)
print(z.grad.data)
```

TensorFlow

(more detail)

TensorFlow: Neural Net

Running example: Train a two-layer ReLU network on random data with L2 loss

```
N, D, H = 64, 1000, 100
x = tf.placeholder(tf.float32, shape=(N, D))
y = tf.placeholder(tf.float32, shape=(N, D))
w1 = tf.placeholder(tf.float32, shape=(D, H))
w2 = tf.placeholder(tf.float32, shape=(H, D))

h = tf.maximum(tf.matmul(x, w1), 0)
y_pred = tf.matmul(h, w2)
diff = y_pred - y
loss = tf.reduce_mean(tf.reduce_sum(diff ** 2, axis=1))

grad_w1, grad_w2 = tf.gradients(loss, [w1, w2])

with tf.Session() as sess:
    values = {x: np.random.randn(N, D),
              w1: np.random.randn(D, H),
              w2: np.random.randn(H, D),
              y: np.random.randn(N, D),}
    out = sess.run([loss, grad_w1, grad_w2],
                   feed_dict=values)
    loss_val, grad_w1_val, grad_w2_val = out
```

TensorFlow: Neural Net

```
import numpy as np
import tensorflow as tf
```

(Assume imports at the top of each snipppet)

```
N, D, H = 64, 1000, 100
x = tf.placeholder(tf.float32, shape=(N, D))
y = tf.placeholder(tf.float32, shape=(N, D))
w1 = tf.placeholder(tf.float32, shape=(D, H))
w2 = tf.placeholder(tf.float32, shape=(H, D))

h = tf.maximum(tf.matmul(x, w1), 0)
y_pred = tf.matmul(h, w2)
diff = y_pred - y
loss = tf.reduce_mean(tf.reduce_sum(diff ** 2, axis=1))

grad_w1, grad_w2 = tf.gradients(loss, [w1, w2])

with tf.Session() as sess:
    values = {x: np.random.randn(N, D),
              w1: np.random.randn(D, H),
              w2: np.random.randn(H, D),
              y: np.random.randn(N, D),}
    out = sess.run([loss, grad_w1, grad_w2],
                   feed_dict=values)
    loss_val, grad_w1_val, grad_w2_val = out
```

TensorFlow: Neural Net

그래프 **정의**하는 부분

```
N, D, H = 64, 1000, 100
x = tf.placeholder(tf.float32, shape=(N, D))
y = tf.placeholder(tf.float32, shape=(N, D))
w1 = tf.placeholder(tf.float32, shape=(D, H))
w2 = tf.placeholder(tf.float32, shape=(H, D))

h = tf.maximum(tf.matmul(x, w1), 0)
y_pred = tf.matmul(h, w2)
diff = y_pred - y
loss = tf.reduce_mean(tf.reduce_sum(diff ** 2, axis=1))

grad_w1, grad_w2 = tf.gradients(loss, [w1, w2])
```

Side Note: Theano

TensorFlow is similar in many ways to **Theano** (earlier framework from Montreal)

```
import theano
import theano.tensor as T

# Batch size, input dim, hidden dim, num classes
N, D, H, C = 64, 1000, 100, 10

x = T.matrix('x')
y = T.vector('y', dtype='int64')
w1 = T.matrix('w1')
w2 = T.matrix('w2')

# Forward pass: Compute scores
a = x.dot(w1)
a_relu = T.nnet.relu(a)
scores = a_relu.dot(w2)

# Forward pass: compute softmax loss
probs = T.nnet.softmax(scores)
loss = T.nnet.categorical_crossentropy(probs, y).mean()

# Backward pass: compute gradients
dw1, dw2 = T.grad(loss, [w1, w2])

f = theano.function(
      inputs=[x, y, w1, w2],
      outputs=[loss, scores, dw1, dw2],
    )
```

optimizer = torch.optim.SGD(model.parameters(), lr=1e-4)
for t in range(500):
    y_pred = model(x)
    loss = criterion(y_pred, y)

    optimizer.zero_grad()
    loss.backward()
    optimizer.step()
```

PyTorch: DataLoaders

학습중 disk에서 mini-batch를 가져오는 작업을 멀티스레딩을 통하여 관리

```
import torch
from torch.autograd import Variable
from torch.utils.data import TensorDataset, DataLoader

N, D_in, H, D_out = 64, 1000, 100, 10

x = torch.randn(N, D_in)
y = torch.randn(N, D_out)

loader = DataLoader(TensorDataset(x, y), batch_size=8)

model = TwoLayerNet(D_in, H, D_out)

criterion = torch.nn.MSELoss(size_average=False)
optimizer = torch.optim.SGD(model.parameters(), lr=1e-4)
for epoch in range(10):
    for x_batch, y_batch in loader:
        x_var, y_var = Variable(x), Variable(y)
        y_pred = model(x_var)
        loss = criterion(y_pred, y_var)

        optimizer.zero_grad()
        loss.backward()
        optimizer.step()
```

PyTorch: DataLoaders

Dataloader 객체를 돌면서 반복 시마다 mini-batch를 적절하게 반환

```
import torch
from torch.autograd import Variable
from torch.utils.data import TensorDataset, DataLoader

N, D_in, H, D_out = 64, 1000, 100, 10

x = torch.randn(N, D_in)
y = torch.randn(N, D_out)

loader = DataLoader(TensorDataset(x, y), batch_size=8)

model = TwoLayerNet(D_in, H, D_out)

criterion = torch.nn.MSELoss(size_average=False)
optimizer = torch.optim.SGD(model.parameters(), lr=1e-4)
for epoch in range(10):
    for x_batch, y_batch in loader:
        x_var, y_var = Variable(x), Variable(y)
        y_pred = model(x_var)
        loss = criterion(y_pred, y_var)

        optimizer.zero_grad()
        loss.backward()
        optimizer.step()
```

PyTorch: Pretrained Models

Super easy to use pretrained models with torch vision https://github.com/pytorch/vision

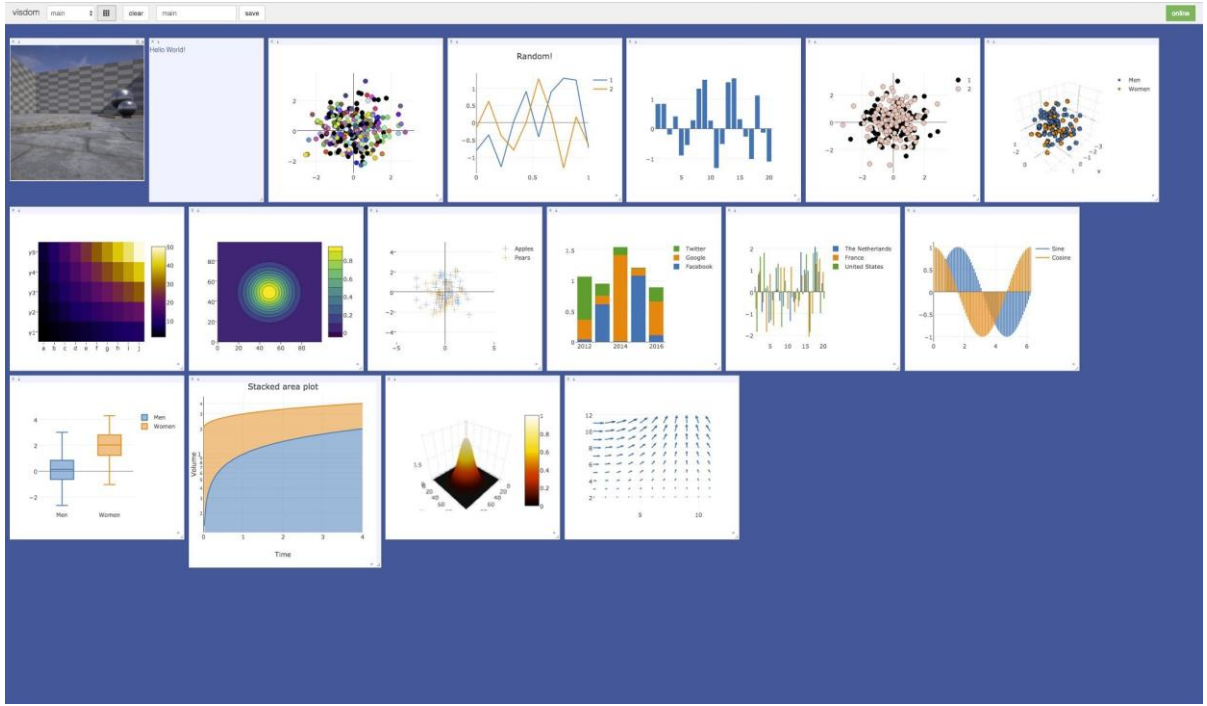
```
import torch
import torchvision

alexnet = torchvision.models.alexnet(pretrained=True)
vgg16 = torchvision.models.vgg16(pretrained=True)
resnet101 = torchvision.models.resnet101(pretrained=True)
```

PyTorch: Visdom

Somewhat similar to TensorBoard: add logging to your code, then visualized in a browser

Can't visualize computational graph structure (yet?)



https://github.com/facebookresearch/visdom

Aside: Torch

- Torch의 진화가 Pytorch이다.

- PyTorch의 일부가 Torch와 유사하다.

- PyTorch의 추상화레벨 단계: **Tensor**, **Variable**, and **Module**

Torch only has 2: **Tensor**, **Module**

```
require 'torch'
require 'nn'
require 'optim'

local N, D, H, C = 64, 256, 512, 10

local model = nn.Sequential()
model:add(nn.Linear(D, H))
model:add(nn.ReLU())
model:add(nn.Linear(H, C))
local loss_fn = nn.CrossEntropyCriterion()

local x = torch.randn(N, D)
local y = torch.Tensor(N):random(C)
local weights, grad_weights = model:getParameters()

local function f(w)
  assert(w == weights)
  local scores = model:forward(x)
  local loss = loss_fn:forward(scores, y)

  grad_weights:zero()
  local grad_scores = loss_fn:backward(scores, y)
  local grad_x = model:backward(x, grad_scores)

  return loss, grad_weights
end

local state = {learningRate=1e-3}
for t = 1, 100 do
  optim.adam(f, weights, state)
end
```

Torch vs PyTorch

Torch

(–) Lua

(–) No autograd

(+) More stable

(+) Lots of existing code

(0) Fast

(–) backpropagation 코드 직접 작성해줘야함

PyTorch

(+) Python

(+) Autograd

(–) Newer, still changing (–) Less existing code

(0) Fast

Conclusion: Probably use PyTorch for new projects

TensorFlow vs PyTorch

- TensorFlow: 그래프를 명시적으로 구성 후 실행
  - Static computational graph - 그래프가 하나

- PyTorch: forward pass를 할 때마다 매번 그래프를 다시 구성
  - Dynamic computational graph

Static vs Dynamic Graphs

TensorFlow: Build graph once, the n run many times (**static**)

```
N, D, H = 64, 1000, 100
x = tf.placeholder(tf.float32, shape=(N, D))
y = tf.placeholder(tf.float32, shape=(N, D))
w1 = tf.Variable(tf.random_normal((D, H)))
w2 = tf.Variable(tf.random_normal((H, D)))

h = tf.maximum(tf.matmul(x, w1), 0)
y_pred = tf.matmul(h, w2)
diff = y_pred - y
loss = tf.reduce_mean(tf.reduce_sum(diff ** 2, axis=1))
grad_w1, grad_w2 = tf.gradients(loss, [w1, w2])

learning_rate = 1e-5
new_w1 = w1.assign(w1 - learning_rate * grad_w1)
new_w2 = w2.assign(w2 - learning_rate * grad_w2)
updates = tf.group(new_w1, new_w2)

with tf.Session() as sess:
    sess.run(tf.global_variables_initializer())
    values = {x: np.random.randn(N, D),
              y: np.random.randn(N, D),}
    losses = []
    for t in range(50):
        loss_val, _ = sess.run([loss, updates],
                               feed_dict=values)
```

Build graph

Run each iteration

PyTorch: Each forward pass defin es a new graph (**dynamic**)

```
import torch
from torch.autograd import Variable

N, D_in, H, D_out = 64, 1000, 100, 10
x = Variable(torch.randn(N, D_in), requires_grad=False)
y = Variable(torch.randn(N, D_out), requires_grad=False)
w1 = Variable(torch.randn(D_in, H), requires_grad=True)
w2 = Variable(torch.randn(H, D_out), requires_grad=True)

learning_rate = 1e-6
for t in range(500):
    y_pred = x.mm(w1).clamp(min=0).mm(w2)
    loss = (y_pred - y).pow(2).sum()

    if w1.grad: w1.grad.data.zero_()
    if w2.grad: w2.grad.data.zero_()
    loss.backward()

    w1.data -= learning_rate * w1.grad.data
    w2.data -= learning_rate * w2.grad.data
```

New graph each iteration

Static vs Dynamic: Optimization

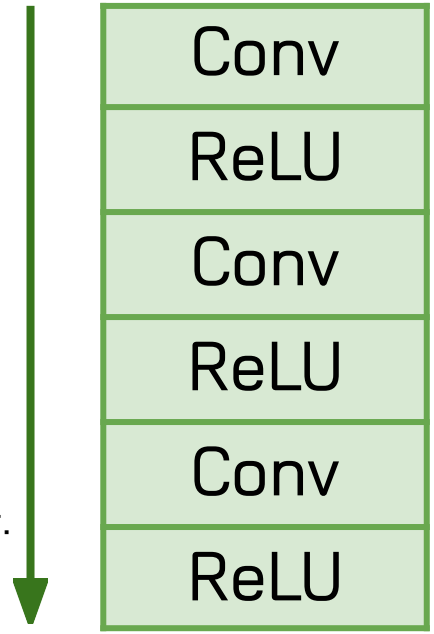
Static 그래프– 그래프 한번 구성

학습시 똑같은 그래프를 재사용한다.

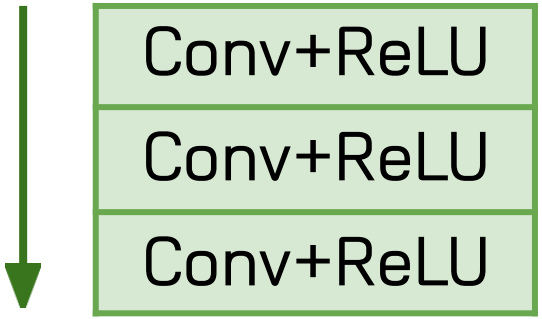
그래프 **최적화**가 가능하다.

→ 최적화 하는데 까지는 시간이 오래 걸리지만, 한번 만든 그래프를 반복해서 사용하므로 최적화 된 그래프가 더 낫다.

The graph you wrote



Equivalent graph with **fused operations**



Static vs Dynamic: Serialization

Static

Once graph is built, can **seri alize** it and run it without th e code that built the graph!

Dynamic

Graph building and execution are in tertwined, so always need to keep code around

Serialization(시리얼라이제이션, 직렬화): 그래프를 한번 구성 해놓으면 메모리 내에 그 네트워크 구조를 가지고 있음을 의미

→ 그 자체를 Disk에 저장할 수 있으며 네트워크 전체를 파일 형태로 저장 가능하다.
→ 원본 코드 없이 불러올 수 있다.

Static vs Dynamic: Conditional

$$y = \begin{cases} w1 * x & \text{if } z > 0 \\ w2 * x & \text{otherwise} \end{cases}$$

- Dynamic computational graph의 경우 대부분 코드가 더 깔끔

  → 위의 두 가지 경우 중 골라가면서 매번 새로운 그래프를 그린다.

Static vs Dynamic: Conditional

$$y = \begin{cases} w1 * x & \text{if } z > 0 \\ w2 * x & \text{otherwise} \end{cases}$$

PyTorch: Normal Python

```
N, D, H = 3, 4, 5

x = Variable(torch.randn(N, D))
w1 = Variable(torch.randn(D, H))
w2 = Variable(torch.randn(D, H))

z = 10
if z > 0:
    y = x.mm(w1)
else:
    y = x.mm(w2)
```

TensorFlow: Special TF control flow operator!

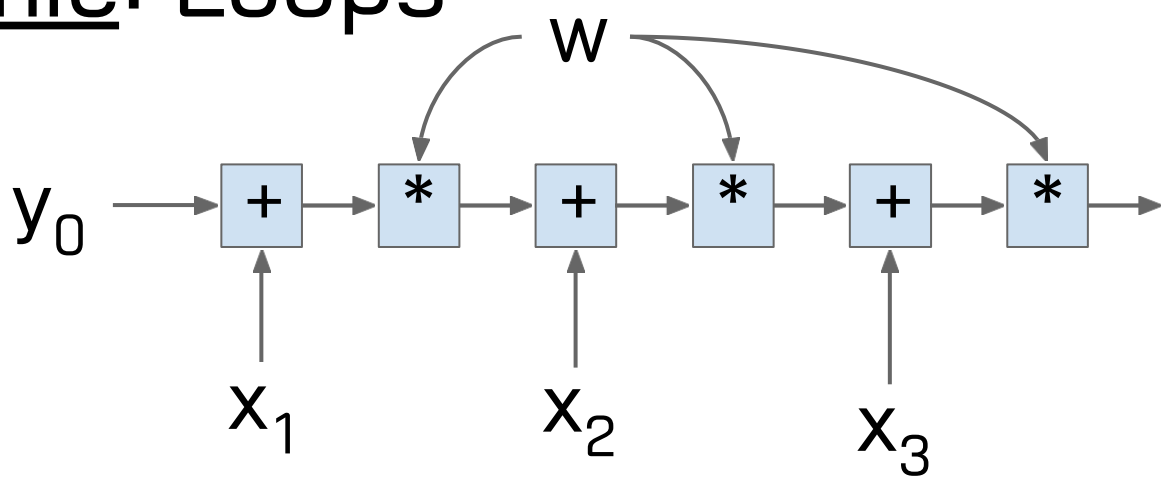
```
N, D, H = 3, 4, 5
x = tf.placeholder(tf.float32, shape=(N, D))
z = tf.placeholder(tf.float32, shape=None)
w1 = tf.placeholder(tf.float32, shape=(D, H))
w2 = tf.placeholder(tf.float32, shape=(D, H))

def f1(): return tf.matmul(x, w1)
def f2(): return tf.matmul(x, w2)
y = tf.cond(tf.less(z, 0), f1, f2)
with tf.Session() as sess:
    values = {
        x: np.random.randn(N, D),
        z: 10,
        w1: np.random.randn(D, H),
        w2: np.random.randn(D, H),
    }
    y_val = sess.run(y, feed_dict=values)
```

control flow operator

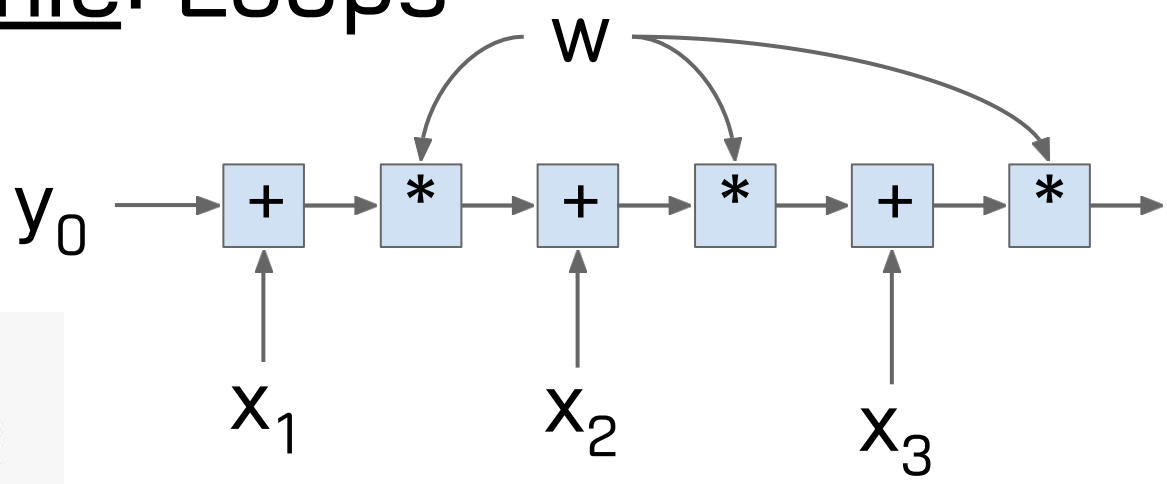
Static vs Dynamic: Loops

$y_t = (y_{t-1} + x_t) * w$



Static vs Dynamic: Loops

$$y_t = (y_{t-1} + x_t) * w$$



PyTorch: Normal Python

```
T, D = 3, 4
y0 = Variable(torch.randn(D))
x = Variable(torch.randn(T, D))
w = Variable(torch.randn(D))

y = [y0]
for t in range(T):
    prev_y = y[-1]
    next_y = (prev_y + x[t]) * w
    y.append(next_y)
```

파이토치에서는 그냥 for문 사용 가능

Static vs Dynamic: Loops

$$y_t = (y_{t-1} + x_t) * w$$

PyTorch: Normal Python

```
T, D = 3, 4
y0 = Variable(torch.randn(D))
x = Variable(torch.randn(T, D))
w = Variable(torch.randn(D))

y = [y0]
for t in range(T):
    prev_y = y[-1]
    next_y = (prev_y + x[t]) * w
    y.append(next_y)
```

TensorFlow: Special TF control flow

```
T, N, D = 3, 4, 5
x = tf.placeholder(tf.float32, shape=(T, D))
y0 = tf.placeholder(tf.float32, shape=(D,))
w = tf.placeholder(tf.float32, shape=(D,))

def f(prev_y, cur_x):
    return (prev_y + cur_x) * w

y = tf.foldl(f, x, y0)
```

재귀적 관계를 정의해두어야함

```
with tf.Session() as sess:
    values = {
        x: np.random.randn(T, D),
        y0: np.random.randn(D),
        w: np.random.randn(D),
    }
    y_val = sess.run(y, feed_dict=values)
```

따라서 TensorFlow과 같은 Static computational graph의 경우

Computational graph의 전체 흐름을 미리 다 구상해 놓아야 한다.

→ 가능한 모든 control flow를 고려하여 그래프 내에 한번에 넣어주어야 한다.

Dynamic Graphs in TensorFlow

TF Fold라는 라이브러리는 dynamic graph를 가능하게 해준다.

→ But 실제로 dynamic graph인 것은 아니고 static graph로 만든 trick이다.

Looks et al, “Deep Learning with Dynamic Computation Graphs”, ICLR 2017 https://github.com/tensorflow/fold

Dynamic Graph Applications

- Recurrent networks

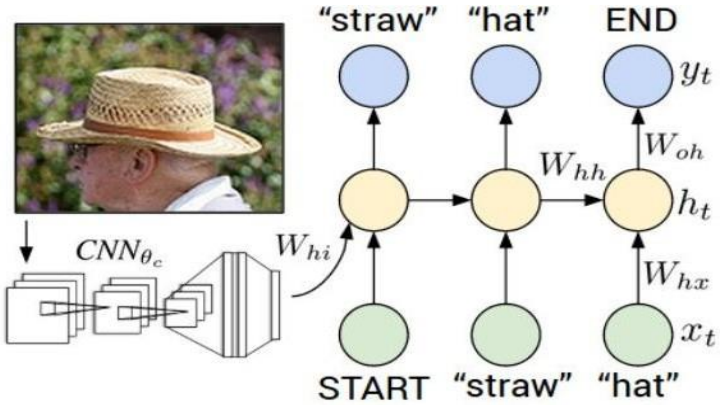


Image captioning
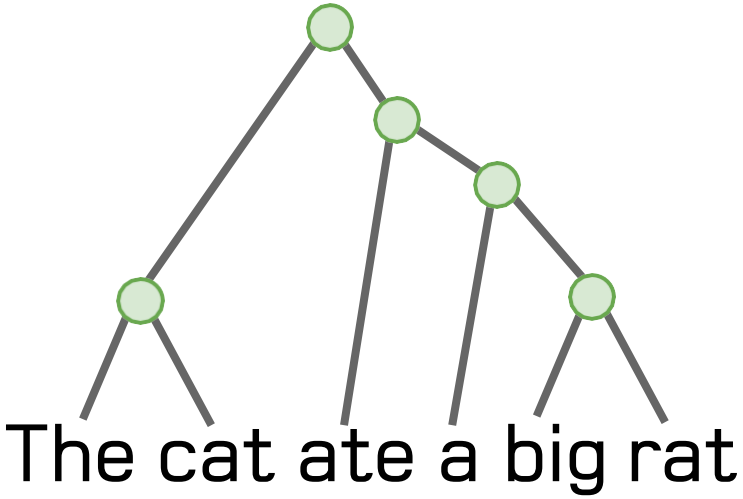
– 다양한 길이의 sequence 다루기 위하여 RNN을 이용한다.

– 보통 RNN에서 Dynamic graph를 필요로 한다.

Karpathy and Fei-Fei, "Deep Visual-Semantic Alignments for Generating Image Descriptions", CVPR 2015
Figure copyright IEEE, 2015. Reproduced for educational purposes.

Dynamic Graph Applications

- Recurrent networks
- Recursive networks



Dynamic Graph Applications

- Recurrent networks
- Recursive networks
- Modular Networks (VQS연구)

Dynamic Graph Applications

- Recurrent networks
- Recursive networks
- Modular Networks
- 더 많은 것들을 할 수 있다.

Caffe

(UC Berkeley)

Caffe: Training / Finetuning

No need to write code!

1. Convert data (run a script)
2. Define net (edit prototxt)
3. Define solver (edit prototxt)
4. Train (with pretrained weights) (run a script)

– 기존 빌드된 바이너리 호출, configuration 파일 수정하는 방식 등으로 data 학습이 가능하다.

Caffe step 1: Convert Data

- DataLayer reading from LMDB is the easiest
- Create LMDB using convert_imageset
- Need text file where each line is
  - “[path/to/image.jpeg] [label]”
- Create HDF5 file yourself using h5py

- 변환해주는 script을 이용하여 Data를 HDF5나 LMDB로 바꿔준다.
- 그래프를 구성하면 prototxt 텍스트파일을 실행한다.

Caffe step 2: Define Network (prototxt)

```
name: "LogisticRegressionNet"
layers {
  top: "data"
  top: "label"
  name: "data"
  type: HDF5_DATA
  hdf5_data_param {
    source: "examples/hdf5_classification/data/train.txt"
    batch_size: 10
  }
  include {
    phase: TRAIN
  }
}
layers {
  bottom: "data"
  top: "fc1"
  name: "fc1"
  type: INNER_PRODUCT
  blobs_lr: 1
  blobs_lr: 2
  weight_decay: 1
  weight_decay: 0
  inner_product_param {
    num_output: 2
    weight_filler {
      type: "gaussian"
      std: 0.01
    }
    bias_filler {
      type: "constant"
      value: 0
    }
  }
}
layers {
  bottom: "fc1"
  bottom: "label"
  top: "loss"
  name: "loss"
  type: SOFTMAX_LOSS
}
```

Caffe step 2: Define Network (prototxt)

- .prototxt can get ugly for big models
- ResNet-152 prototxt is 6775 lines long!
- Not "compositional"; can't easily define a residual block and reuse

```
name: "ResNet-152"
input: "data"
input_dim: 1
input_dim: 3
input_dim: 224
input_dim: 224

layer {
        bottom: "data"
        top: "conv1"
        name: "conv1"
        type: "Convolution"
        convolution_param {
                num_output: 64
                kernel_size: 7
                pad: 3
                stride: 2
                bias_term: false
        }
}

layer {
        bottom: "conv1"
        top: "conv1"
        name: "bn_conv1"
        type: "BatchNorm"
        batch_norm_param {
                use_global_stats: true
        }
}
```

```
layer {
        bottom: "res5c"
        top: "pool5"
        name: "pool5"
        type: "Pooling"
        pooling_param {
                kernel_size: 7
                stride: 1
                pool: AVE
        }
}

layer {
        bottom: "pool5"
        top: "fc1000"
        name: "fc1000"
        type: "InnerProduct"
        inner_product_param {
                num_output: 1000
        }
}

layer {
        bottom: "fc1000"
        top: "prob"
        name: "prob"
        type: "Softmax"
}
```

https://github.com/KaimingHe/deep-residual-networks/blob/master/prototxt/ResNet-152-deploy.prototxt

Caffe step 3: Define Solver (prototxt)

- Write a prototxt file defining a SolverParameter
- If finetuning, copy existing solver.prototxt file
  - Change net to be your net
  - Change snapshot_prefix to your output
  - Reduce base learning rate (divide by 100)
  - Maybe change max_iter and snapshot

```
net: "models/bvlc_alexnet/train_val.prototxt"
test_iter: 1000
test_interval: 1000
base_lr: 0.01
lr_policy: "step"
gamma: 0.1
stepsize: 100000
display: 20
max_iter: 450000
momentum: 0.9
weight_decay: 0.0005
snapshot: 10000
snapshot_prefix: "models/bvlc_alexnet/caffe_alexnet_train"
solver_mode: GPU
```

그래프에 있는걸 전부 다 쓴다고 생각하면 됨

Caffe step 4: Train!

```
./build/tools/caffe train \
  -gpu 0 \
  -model path/to/trainval.prototxt \
  -solver path/to/solver.prototxt \
  -weights path/to/pretrained_weights.caffemodel
```

https://github.com/BVLC/caffe/blob/master/tools/caffe.cpp

Caffe Pros / Cons

파이썬에 의존적이지 않기 때문에
Production 측면에 더 적합

- (+) Good for feedforward networks
- (+) Good for finetuning existing networks
- (+) Train models without writing any code!
- (+) Python interface is pretty useful!
- (+) Can deploy without Python
- (-) Need to write C++ / CUDA for new GPU layers
- (-) Not good for recurrent networks
- (-) Cumbersome for big networks (GoogLeNet, Res Net)

Caffe2
(Facebook)

Caffe2 Overview

- Very new – released a week ago =)
- Static graphs, somewhat similar to TensorFlow
- Core written in C++
- Nice Python interface
- Can train model in Python, then serialize and de ploy without Python
- Works on iOS / Android, etc

Google:
TensorFlow

"One framework to rule them all"

딥러닝 필요한 모든 곳에서 잘 동작한다.

Facebook:
PyTorch +Caffe2

Research

Production

Advice:

- TensorFlow
  - 어떤 project에서든 괜찮다.
  - 단 higher level wrapper나 dynamic graph가 필요한 경우는 사용하지 말 것

- PyTorch
  - Research할 때 강력 추천, 유용하다.

- 제품 배포시 (산업)
  - TensorFlow나 Caffe 1,2

- 모바일 디바이스
  - TensorFlow나 Caffe2
